

Vaping is like a **WEAPON** hidden inside cotton candy

Chemicals

E-juice contains many **TOXIC** chemicals such as diacetyl, which is found in the flavorant. Diacetyl has been linked to a serious lung disease called obliterative bronchiolitis (more commonly known as popcorn lung). Which, currently has no cure and is life threatening. E-Juice also contains lead and nickel. Nickel can cause lung disorders when inhaled. Benzene, which is a big component in gasoline, can cause abnormal heartbeat, confusion and dizziness. It can also harm your immune system, which helps fight infections and illnesses which means you're more prone to getting a cold or something worse. It also damages your cells which results in weaker and damaged bone marrow.

Developmental Problems

Nicotine is an addictive chemical that can damage the development of the brain. When we learn, or see something new we make a connection inside our brain (called synapses). Nicotine changes the way these synapses connect. Which lead to learning difficulties and attention disorders.
